

Turnkey Delivery

Total Data Management

Operational Coherency

Asset Control is the leading provider of centralized data management solutions to the financial industry. Its solutions comprise the deep business knowledge and technical expertise obtained through more than a decade of successful implementations in a prestigious customer base.

Asset Control solutions are deployed to support business challenges such as Basel II, market risk, STP, trading support and portfolio management. Our solutions integrate data, such as price, reference, legal entity and corporate actions data into a centralized data hub, which distributes data and derived data products to users and applications.

The main objectives of Asset Control are to solve our customers' data management challenges through turnkey delivery of solutions, to support total data management, and to enable operational coherency. These three objectives shape our approach to assisting our users to optimize their data for efficiency, cost control, reduced operational risk and increased value from their data.

Turnkey Delivery of Solutions

Asset Control is the only firm in its class to offer turnkey delivery of running solutions. Customer requirements are met from Asset Control's complete range of off-the-shelf modules, proven in customer implementations. Turnkey solutions include installation, data loading and normalization, and customer-specific consolidation for "golden copy" sets. Our objective is to make project costs transparent and predictable, enabling firms to focus on the total project rather than the software.

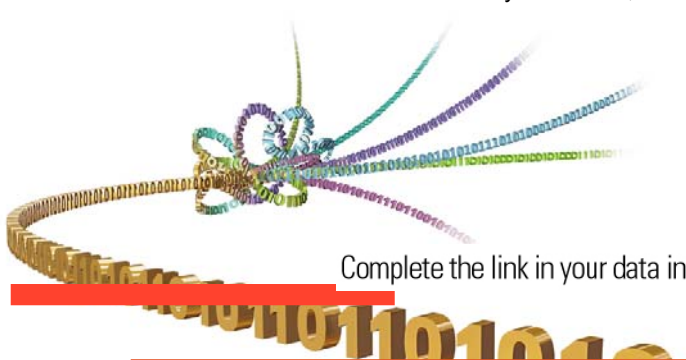

Total Data Management

Total data management (TDM) enables our customers to choose any configuration of (in-house) centralized data management and data management that is shared or outsourced. Configurations range from complete reliance on in-house or outsourced data management, to hybrids of the two. Our in-house systems link seamlessly with outsourced services, powered by Asset Control and offered by our world-class partners. Users can begin with either type of implementation, expand to a hybrid configuration, and gain the benefits of cost-optimized data management without loss of investment.

Operational Coherency

Operational coherency requires full integration of data, networks and applications for maximum efficiency and stability at the lowest costs. Data management is the primary requirement. Any Asset Control project advances operational coherency, whether in a department or across the entire firm. Our data management solutions also include tools to leverage data management through workflow, networking and end-user solutions.

Asset Control stands alone in its track record of long-standing customer implementations. Our solutions provide our customers the flexibility and scalability to meet current and emerging business needs. A future-proof technology investment, Asset Control is constantly updated to offer state-of-the-industry technology options, such as Linux and XML, and adapt to new industry standards, such as ISO 15022 and MDDL.
